# SX-14

**Safe**

**User-friendly**

**Easy-maintenance**

# Innovative features

## I Simultaneous controlled three section telescopic boom

The simultaneous controlled telescopic boom can access working position more easily than an articulated boom type does.

## II Compact swing table

When the compact swing table rotates, it protrudes from chassis frame only 6 centimeters (2.36inches) at a maximum\*. The risk of collision is drastically diminished.

\*Figures on the basis of ISUZU "NPR75L-HL5VAYRN". Figures may vary slightly according to chassis model.

## III No automatic stop by computer

The working range is regulated by the physical capability of optimally-designed boom in itself. Vision-based operation is available. There is no more worry for being disturbed by frequent automatic stop by computer.

## IV Direct access to the basket

The working basket can be moved to the ground level. Direct access to the basket from the ground makes it easy to load and unload items.

## V Vertical support

Space-saving vertical jack up system makes it possible to operate in the narrow workspace.

## VI Internally routed hoses

Energy hoses are located inside the boom system to be protected from damage and defacement.

## VII Computer-free structure

Electric troubles are prevented due to the scheme of minimizing employment of electric parts. None of devices are regulated by computer. They are free from readjustment by program.

## VIII Preventive setup of inadvertent operation

The boom cannot be operated unless the jacks are up. Likewise, the jacks cannot be operated while the boom is working.
